How to Install the APK from My GitHub Page

Before You Begin

Android requires you to allow apps from outside the Google Play Store (called "unknown sources"). This is normal for APK installations.

1. Download the APK

- Visit my GitHub Page in your phone's browser.
- Tap the **Download APK** link.
- When prompted, tap **Download**. The file will appear in your **Downloads** folder.

2. Allow Installation from Unknown Sources

Android blocks apps from unknown sources by default. Enable this once for my APK:

On Android 8.0 (Oreo) and later:

- When you tap the APK to install, you'll see a warning.
- Tap **Settings** → Enable **Allow from this source** for your browser.
- Go back and tap **Install**.

On Android 7.0 (Nougat) and earlier:

- Go to **Settings** → **Security** → Enable **Unknown Sources**.
- Tap the APK file again to start the installation.

3. Install the App

- Open the **Downloads** folder (or notification bar).
- Tap the APK file.
- Tap **Install**. After it finishes, tap **Open** to launch the app.

4. (Optional) Revoke the Permission

For security, you can disable the unknown sources option after installation:

Settings → Apps & notifications → Special app access → Install unknown apps → Disable your browser.

Alternative Method: Download on PC, Then Transfer to Phone

- Download the APK on your computer from my GitHub page.

- Connect your phone to your computer using a USB cable.

- On your phone, set the USB mode to **File Transfer**.

- Copy the APK file from your computer to your phone's **Downloads** folder (or any folder you remember).

- Safely disconnect your phone from the computer.

- On your phone, open the file manager or Downloads app and tap the APK file.

- Follow the same installation steps (enable unknown sources if prompted).

Important Notes

- Only download my APK from the official GitHub page link.

- Keep your device updated for security.

- If you see **Play Protect warning**, it's because the app isn't on Play Store. Tap **Install Anyway** if you trust my app.
